

Orientably-regular maps with no non-trivial exponents

Veronika Bachratá, joint work with Martin Bachratý*

*Slovak University of Technology

Algebraic Graph Theory International Webinar, 7 March 2023

What we want to proof

Theorem 1.1

For every hyperbolic pair (k, m) there exists infinitely many orientably-regular maps of type $\{m, k\}$ with no non-trivial exponents.

What we want to proof

Theorem 1.1

For every hyperbolic pair (k, m) there exists infinitely many orientably-regular maps of type $\{m, k\}$ with no non-trivial exponents.

- ◇ Orientable maps
- ◇ Orientably-regular maps
- ◇ Maps of type $\{m, k\}$
- ◇ Exponents of orientable maps
- ◇ How we proof this

Part 1: Orientable maps

Orientable maps

Definition

Symmetries

Type of map

Permutations \mathcal{L} and \mathcal{R}

An **orientable map** is a 2-cell embedding of a graph on an orientable surface.

Orientable maps

Definition

Symmetries

Type of map

Permutations \mathcal{L} and \mathcal{R}

An **orientable map** is a 2-cell embedding of a graph on an orientable surface.

Definition

Symmetries

Type of map

Permutations \mathcal{L} and \mathcal{R}

An **automorphism** of a map \mathcal{M} is a bijection that preserves the map structure. Orientation-preserving automorphisms form a group $\text{Aut}^+(\mathcal{M})$.

Hence $|\text{Aut}^+(\mathcal{M})| \leq |\mathcal{D}(\mathcal{M})|$.

If $|\text{Aut}^+(\mathcal{M})| = |\mathcal{D}(\mathcal{M})|$ we say that \mathcal{M} is **orientably-regular**.

Orientable maps

Definition

Symmetries

Type of map

Permutations \mathcal{L} and \mathcal{R}

The **valency** k of \mathcal{M} is the least common multiple of valencies of vertices.

The **covalency** m of \mathcal{M} is the least common multiple of valencies of faces.

We say that \mathcal{M} has **type** $\{m, k\}$ and corresponds with pair (k, m) .

Orientable maps

Definition

Symmetries

Type of map

Permutations \mathcal{L} and \mathcal{R}

Map $\mathcal{M} = (\mathcal{D}, \mathcal{L}, \mathcal{R})$ has type $\{\text{ord}(\mathcal{L}\mathcal{R}), \text{ord}(\mathcal{R})\}$.

Map \mathcal{M} is orientably-regular if and only if $|G| = |\mathcal{D}|$, where $G = \langle \mathcal{R}, \mathcal{L} \rangle$.

$\mathcal{E} \in \text{Sym}(\mathcal{D})$ is an orientation-preserving automorphism of $\mathcal{M} = (\mathcal{D}, \mathcal{L}, \mathcal{R})$ if and only if $\mathcal{R}\mathcal{E} = \mathcal{E}\mathcal{R}$ and $\mathcal{L}\mathcal{E} = \mathcal{E}\mathcal{L}$.

There is an o-p isomorphism between $\mathcal{M}_1 = (\mathcal{D}, \mathcal{L}_1, \mathcal{R}_1)$ and $\mathcal{M}_2 = (\mathcal{D}, \mathcal{L}_2, \mathcal{R}_2)$ if and only if there exists $\mathcal{E} \in \text{Sym}(\mathcal{D})$ such that $\mathcal{R}_1\mathcal{E} = \mathcal{E}\mathcal{R}_2$ and $\mathcal{L}_1\mathcal{E} = \mathcal{E}\mathcal{L}_2$.

Group $\text{Aut}^+(\mathcal{M})$ is the centraliser of G in $\text{Sym}(\mathcal{D})$.

For every hyperbolic pair (k, m) there exists infinitely many orientably-regular maps of type $\{m, k\}$ with no non-trivial exponents.

Part 3: Idea of the proof

Idea of the proof

Base maps

Canonical regular covers

Example

Conclusion

Instead of constructing orientably-regular maps for every hyperbolic type $\{m, k\}$, we construct a single orientable map $\mathcal{M} = (\mathcal{D}, \mathcal{L}, \mathcal{R})$ such that:

- ◇ \mathcal{M} has type $\{m, k\}$
- ◇ \mathcal{M} has at least 7 darts
- ◇ $\langle \mathcal{L}, \mathcal{R} \rangle = \text{Alt}(\mathcal{D})$ or $\text{Sym}(\mathcal{D})$
- ◇ \mathcal{M} has no non-trivial exponents

Idea of the proof

Base maps

Canonical regular covers

Example

Conclusion

Instead of constructing orientably-regular maps for every hyperbolic type $\{m, k\}$, we construct a single orientable map $\mathcal{M} = (\mathcal{D}, \mathcal{L}, \mathcal{R})$ such that:

- ◇ \mathcal{M} has type $\{m, k\}$
- ◇ \mathcal{M} has at least 7 darts
- ◇ $\langle \mathcal{L}, \mathcal{R} \rangle = \text{Alt}(\mathcal{D})$ or $\text{Sym}(\mathcal{D})$
- ◇ \mathcal{M} has no non-trivial exponents

Then we take the **canonical regular cover** $\mathcal{M}' = (\langle \mathcal{L}, \mathcal{R} \rangle, \mathcal{L}, \mathcal{R})$ of \mathcal{M} .

- ◇ \mathcal{M} and \mathcal{M}' have the same type
- ◇ \mathcal{M}' is always orientably-regular
- ◇ if $|\mathcal{D}| \geq 7$, $\langle \mathcal{L}, \mathcal{R} \rangle = \text{Alt}(\mathcal{D})$ or $\text{Sym}(\mathcal{D})$, and \mathcal{M} has no non-trivial exponents, then \mathcal{M}' has no non-trivial exponents

Idea of the proof

- ◇ $\{k, k\}$ for $k \geq 10$
- ◇ $\{k + 1, k\}$ and $\{k, k + 1\}$ for $k \geq 8$
- ◇ $\{m, k\}$ and $\{k, m\}$ for $k \geq 6$ and $k + 2 \leq m \leq 2k - 4$
- ◇ $\{m, k\}$ and $\{k, m\}$ for $k \geq 5$ and $\max(9, 2k - 3) \leq m \leq 4k - 11$
- ◇ $\{m, k\}$ and $\{k, m\}$ for $k \geq 5$ and $m \geq 3k - 3$
- ◇ $\{m, 4\}$ and $\{4, m\}$ for $m \geq 13$
- ◇ $\{3, k\}$ and $\{k, 3\}$ for $k = 13$ and $k \geq 15$

This leaves 51 hyperbolic pairs, for which we have found suitable permutations \mathcal{R} and \mathcal{L} .

Idea of the proof

Base maps

Canonical regular covers

Example

Conclusion

Figure: Base maps of types $\{m, k\}$ and $\{k, m\}$ for $k \geq 5$ and $\max(9, 2k-3) \leq m \leq 4k-11$

Idea of the proof

Base maps

Canonical regular covers

Example

Conclusion

Figure: Base maps of types $\{m, 4\}$ and $\{4, m\}$ for $m \geq 13$
